## Executive Summary

applied AI systems & software architecture

I am an **AI Systems Engineer & Distributed Architect** specializing in autonomous multi-agent swarms, sub-second multimodal audio/vision pipelines, and enterprise microservices. My engineering focus addresses the critical gap between raw foundation models and resilient production execution: deterministic state machines, Celery priority queues (High/Default/Bulk), citation-validated vector retrieval (RAG), tamper-proof HMAC audit ledgers, and zero-allocation hot execution loops.

Over the past years, I have architected and shipped **16+ comprehensive software systems** from architectural concept to full production deployment: autonomous agent factories, real-time GPU-accelerated speech-to-speech translation HUDs, adaptive multimodal learning engines, multi-currency accounting ledgers, and physics-driven 3D/2D games.

## Core Engineering Pillars

architectural domain expertise

### 1. Autonomous Multi-Agent Swarms

Orchestrating multi-agent collaboration with Celery priority message queues (0/3/9), human-in-the-loop approvals, and zero-hallucination citation validation against live web sources.

### 2. Sub-Second Multimodal & Speech

WASAPI loopback audio capture, Butterworth high-pass digital filters, GPU-accelerated Whisper transcribing, Gemini Live bidirectional WebSockets, and OpenCV frame diffing.

### 3. Enterprise Microservices & Fintech

C# .NET 10 Clean Architecture, FastAPI microservices, double-entry general ledgers, Qdrant vector retrieval, RabbitMQ outbox patterns, and enterprise RTL typesetting engines.

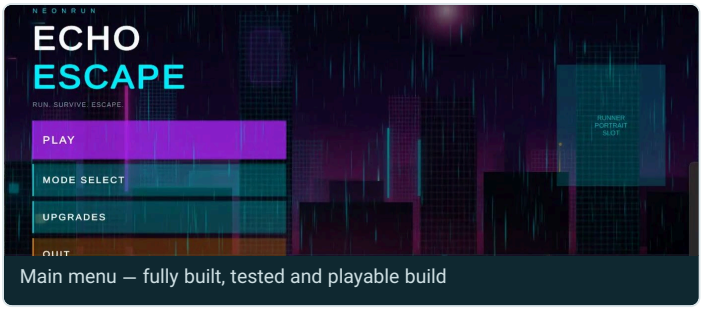

### 4. Systems Programming & Physics

Electron ASAR binary reverse engineering, SHA-256 base64 re-signing algorithms, strict Zero-GC hot execution loops in game engines, and parabolic projectile trajectory physics.

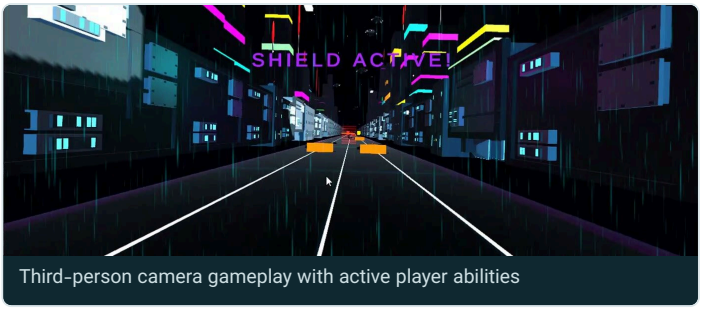

## Neon Run: Echo's Escape

3D multi-platform game · flagship gaming project

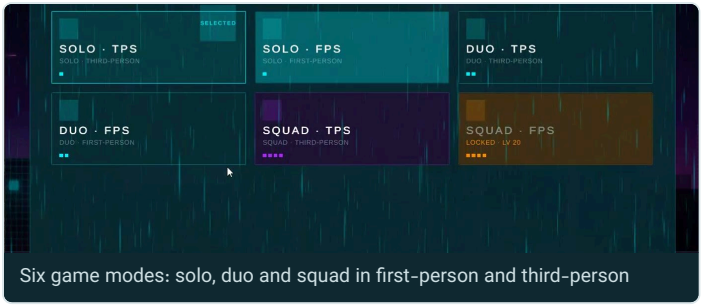

An endless runner set in a cyberpunk future (year 2189): corporations control the city, and a girl named Echo must evade a corporate AI security grid. Built with five levels, six game modes, and two narrative endings. I architected the complete technical core: dual-camera rendering, HUD systems, procedural track pooling, and single-device split-screen multiplayer.

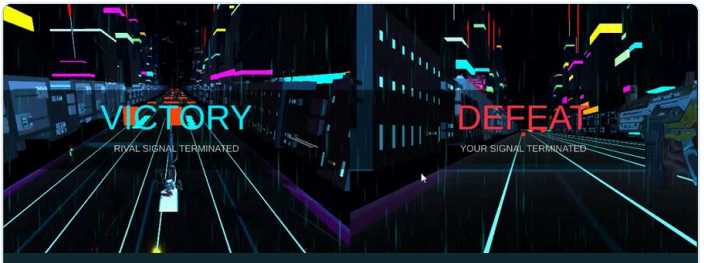

Main menu — fully built, tested and playable build

Third-person camera gameplay with active player abilities

Six game modes: solo, duo and squad in first-person and third-person

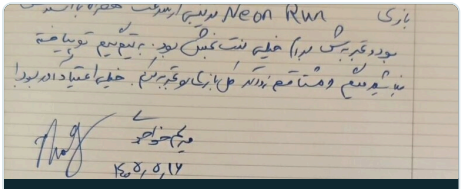

Two-player split-screen mode with dynamic winner resolution

**Technical implementation:** Dual-camera perspective controllers, live scoring and persistence, special abilities (shield & speed boost), upgrade store, endless procedural track generation with zero heap allocations in Update, single-screen competitive split-screen multiplayer, and identical cross-platform parity on Android, PC, and OpenXR VR.
**Status:** Preparing for public release with complete narrative progression and bilingual voice lines.

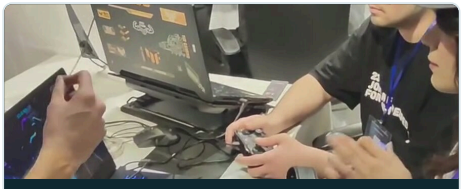

## Market Feedback & Public Reception

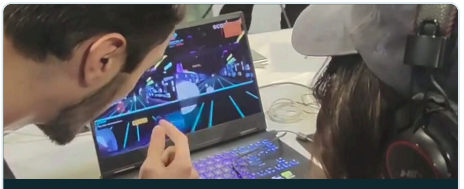

A playable build of Neon Run was showcased on a dedicated booth at the Negative Five accelerator event, where dozens of visitors, streamers, and studio leads playtested the build:

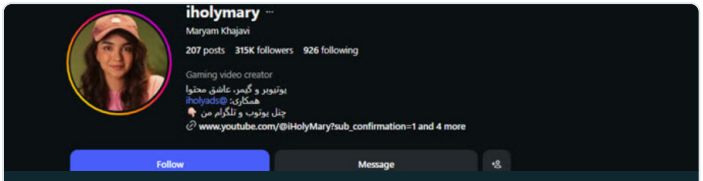

> **"… I really enjoyed the experience … it was seriously addictive!"**
>
> — Maryam Khajavi (iholymary), gaming content creator with over 315,000 Instagram followers and active YouTube channel — after playing Neon Run at the event · handwritten and signed note

## UniversalSystem — Autonomous AI Software Factory

distributed AI systems

UniversalSystem is an enterprise multi-agent orchestration platform that automates software generation, multimodal synthesis, automated test suites, and long-term project memory. Architected with isolated containerized microservices, priority Celery message queues, cryptographically tamper-proof HMAC ledgers, and automated failover bridges between cloud and local model sessions. The live health verification is shown on the next page.

| 84,290 | 17 / 17 | 385+ |
|---|---|---|
| lines of code across 432 files | live containerized services healthy | automated test suites passing |

## Architectural Components

role of each microservice

**api-gateway** YARP reverse proxy: centralized auth, rate limiting, and intelligent load balancing.

**dotnet-api** C# .NET 10 Clean Architecture: core domain models, MassTransit outbox, banking rules.

**celery-worker** Distributed background workers with message priority tiers: **High (0)**, **Default (3)**, **Bulk (9)**.

**sqlserver** Relational transactional store: structured schemas, financial audits, and enterprise state.

**rabbitmq** Enterprise message broker: reliable outbox delivery ensuring zero message drops.

**prometheus** Metrics collector: gathers performance metrics across all microservices continuously.

**jaeger** Distributed tracing: end-to-end request lifecycle analysis from gateway to database layers.

**web-frontend** Next.js 15 enterprise console: interactive UI for steering autonomous agents.

**python-ai** AI processing core: multi-agent orchestration, RAG retrieval, document pipelines.

**node-microservices** Event-driven services: real-time device communication and MQTT protocol bridge.

**qdrant** Vector database: dense embeddings and cosine similarity search with exact match thresholds.

**redis** In-memory cache with AOF persistence: agent state caching, session management, rate limits.

**host-bridge** Local Windows bridge: routes overflow requests to authenticated Claude/Codex/Antigravity CLIs.

**grafana** Observability dashboards: real-time tracing of throughput, token latency, and error rates.

**vision-watcher** AI vision sentinel: inspects graphical and UI outputs to flag rendering regressions.

Empirical proof: live system health check with all 17 containerized services verified healthy with passing probes

## Key Architectural Capabilities & Defensive Design

- **Cryptographic HMAC Audit Ledger:** Every agent execution step and administrative decision is logged into an immutable, HMAC-chained hash ledger preventing tampering.
- **Multi-Model Cascade & Local Host Bridge:** Automated fallback when cloud APIs encounter rate limits (429/503), gracefully shifting traffic to local authenticated developer CLI sessions.
- **PII Redaction & SSRF Guardrails:** Automated regex-based scrubbing of credit cards, national IDs, and IBANs, paired with strict outbound connector egress filters against intranet IP ranges.
- **Universal Doc Factory:** 5-stage sequential agent pipeline (Brief ➔ Research ➔ Architecture ➔ Writer ➔ Reviewer) featuring zero-hallucination citation validation against live web sources and Persian/RTL typesetting export to PDF, DOCX, and PPTX.
- **Microsoft AI Architect Academy:** 8-level AI system architecture curriculum featuring advanced Semantic Kernel patterns, AutoGen swarm swarms, GraphRAG knowledge graphs, and MCP server tools in C# .NET.
- **Headless Editor Agent Interop:** Dynamic-port Model Context Protocol (MCP) bridges enabling autonomous agents to inspect, manipulate, and compile game projects headlessly.

## Sub-Second Real-Time Multimodal & Speech Engines

### RapScribe-AI (OmniScribe HUD)

Low-latency transcription & neural translation: Windows WASAPI loopback audio capture ➔ Butterworth HPF & RMS gating ➔ GPU-accelerated faster-whisper large-v3-turbo ➔ Gemini 3.8 Flash cascade across 4 concurrent non-blocking worker threads.

### GeminiLiveCoPilot

Frameless always-on-top desktop HUD over Gemini Live bidirectional WebSocket API: 1fps desktop capture with MSE and SSIM frame-diff deduplication to minimize token consumption, with 16kHz PCM input and 24kHz synthesized output.

### NitroLearnAI (NitroLango)

Adaptive language learning platform covering the complete Menschen CEFR corpus (72 Lektionen from A1.1 to B1.2), 77 interactive German grammar engines, SuperMemo SM-2 spaced repetition decay formula, and resilient browser speech watchdogs.

### German-Neural-Immersion

Automated multimodal course studio parsing textbook PDFs and audio archives into interactive sentence builders (Satzbau) and dual-language synchronized audio lessons synthesized via ElevenLabs neural voices.

## Enterprise SaaS, Fintech, Open Source & Commercial Projects

### ZarDigit — Enterprise Financial & Accounting Suite

**Role:** Systems Architect & Full-Stack Engineer | Next.js 15 · TypeScript · FastAPI · PostgreSQL | Private Enterprise Platform

- Architected a multi-currency double-entry general ledger system with high-precision decimal arithmetic, trial balances, and transaction audit trails.
- Implemented an automated financial statement generation engine (Balance Sheets, Profit & Loss, Cash Flow) with native RTL typesetting support.
- Built invoicing, accounts payable/receivable modules, asset depreciation schedules, and immutable transactional logging.

### antigravity-scroll-unpin — Reverse Engineering & Open Source Tool ⭐

**Role:** Tool Architect & Author | Node.js · PowerShell · Electron ASAR · SHA-256 Digest | Public Open Source Repository

- Deconstructed Electron's binary app.asar archive in Google Antigravity to unpin and disable sticky headers within chat panels.
- Implemented the exact VS Code product.json cryptographic SHA-256 base64 digest calculation algorithm, completely eliminating the "Installation Corrupt" warning.
- Engineered an automated 1-click patching pipeline featuring non-destructive atomic backups (.bak) and instantaneous single-command rollback (--restore).

### Arash Kamangir — Commercial Mobile Game

**Role:** Lead Gameplay & Tools Programmer | Ferdowsi University of Mashhad Science & Technology Park | 2024 – present

- Implemented parabolic arrow trajectory physics, dynamic bow tension mechanics, and multi-joint stickman ragdoll collisions (Box2D).
- Developed custom Unity Editor tools (EditorWindows) enabling non-technical game designers to visually configure level waves and enemy paths.
- Executed deep memory optimization and physics loop profiling to secure a locked 60 FPS on low-end budget Android hardware.

### Bus Jam Case & TravelTown — Algorithmic Routing & Merge Progression Engines

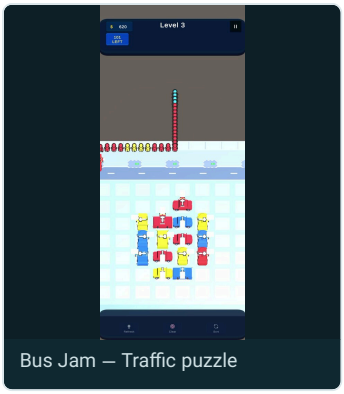

**Role:** Algorithm Designer & Gameplay Logic Developer | Unity · C# · A* Pathfinding · Binary State | Independent Projects

- **Bus Jam Case:** Multi-agent A* grid pathfinding for collision-free vehicle evacuation, passenger queue management, and mobile CPU profiling.
- **TravelTown:** Branching merge item generator graphs, merge validation logic, and compact binary state serialization.

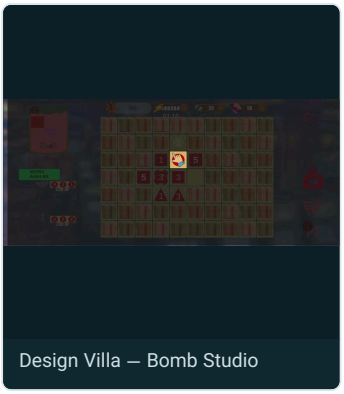

### Parsa & Design Villa (Blood Castle) — Published Commercial Mobile Games 🚀

**Role:** Lead Technical & Systems Programmer | **Bomb Game Studio** | Published on Cafe Bazaar & Myket

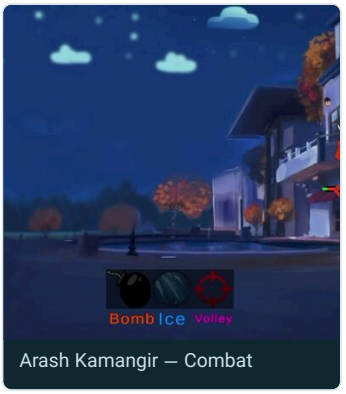

- **Parsa (Download on Cafe Bazaar):** Commercial action mobile game; engineered core gameplay systems, UI data-binding, player state persistence, Android multi-version compatibility, and successful store publication.
- **Design Villa / Blood Castle:** Casual puzzle and renovation title; modular decoration engine, decoration finite state machine (FSM), and texture streaming memory profiling.

Bus Jam — Traffic puzzle

Design Villa — Bomb Studio

Parsa — Commercial title

Arash Kamangir — Combat

## National Honors, Industry Recognition & Elite Talent Credentials

### Negative Five International Accelerator — Third Cycle National Competition · 2026

National Award Winner

**Top National Ranking & Award Winner** in the accelerator entry competition showcasing Neon Run: Echo's Escape; awarded official certificate and honor on stage signed by the Accelerator CEO and Xelerate VR Representative

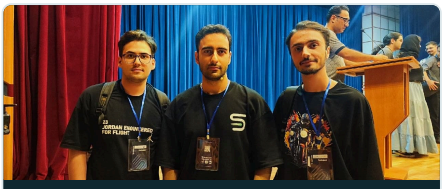

- **National Award & Official Recognition:** Won top national honors among competing engineering and interactive systems; formally honored on stage during the closing ceremony.
- **Elite Talent & Global Talent Visa Evidence:** Possesses substantial legal and evidentiary value for National Elites evaluation and international Global Talent / Exceptional Talent immigration streams (UK Tech Nation, US O-1A / EB-1A, EU Talent) as primary proof of recognized national achievement.
- **Dedicated Live Showcase Booth:** Operated a fully equipped live playtest booth throughout the event; audited and playtested on controller by industry leaders, judges, and studio heads.
- **Mass Audience & Media Coverage:** Live broadcast and featured coverage by prominent gaming creators reaching 315,000+ active followers, accompanied by signed handwritten testimonials.

## Mentorship, Knowledge Transfer & Video Archive

in-person & online archive

**Role:** Private Systems & Game Programming Instructor | Unity Engine & C# / Python | In-person sessions, Mashhad

Mentorship centered on commercial software architecture: memory layout fundamentals, component-based design patterns, connecting AI models via the Model Context Protocol (MCP), zero-allocation performance optimization, and final compilation for Android and Windows targets.

## Video Archive

19 videos · 56 minutes · playable online in any browser

High-resolution recorded footage exists for every major system and game documented in this resume, hosted online without requiring any local installations:

**Neon Run: Echo's Escape — 6 videos**

Solo first-person · solo third-person · two-player split-screen · full 7-minute uncut run · special abilities · endless procedural generation

**Commercial games — 2 videos**

Arash Kamangir · Bus Escape

**Negative Five event — 9 videos**

Maryam Khajavi (315K) playtesting at the booth · studio director walkthrough · dedicated booth tour · stage certificate award · venue atmosphere

**NitroLango — 2 videos**

Comprehensive platform walkthrough · latest update

## The 5-Point Empirical Verification Gate

defensive architecture manifesto

**Core Engineering Philosophy:** A system reporting success for work it did not empirically verify is a failure. Every system I build is governed by five mandatory defensive rules:

- **1. Empirical Proof Mandate:** Zero speculation. No task is certified without exit code 0, 0 compilation errors, exact file paths and line ranges, and clean live verification.
- **2. Defensive State Bounds:** Mandatory validation guards checking for NaN and Infinity prior to mutating spatial transforms, physics vectors, or financial balances.
- **3. Hot-Loop GC Prevention (Zero-GC):** Zero object instantiations (new), zero string concatenations or LINQ queries, and pre-cached Property IDs in per-frame update loops.
- **4. Resilient Watchdogs:** Universal watchdog timeouts and stall recovery mechanisms guarding WebSockets, browser speech APIs, and asynchronous message queues.
- **5. Fail-Closed Security:** Length-only secret inspection, strict credential isolation, SSRF-guarded outbound sinks, and cryptographically chained HMAC audit logs.

## Education, Formal Certifications & Engineering Bootcamps

**Technical & Vocational High School Diploma — Computer Network & Software** — June 2024

Shahed Isar Vocational High School, Mashhad — In-depth systems architecture, OS internals, networking & databases

**Advanced C++ Systems Engineering, Algorithms & Data Structures Bootcamp (Faravin)** — 2021

Vocational High School Internship (11th Grade) — Algorithmic design, number systems, low-level memory allocation & complexity analysis

**Web Development & Database Systems Engineering — Official State Certificate** — 450 Hours

National Technical & Vocational Training Organization — Internationally accredited standard; web architectures, APIs & data pipelines

**Game Dojo Specialized Interactive Systems & Game Engineering Bootcamp** — Comprehensive

Real-time architecture with Unity & C#, event-driven modular design, Zero-GC allocation patterns & profiling

**Advanced Backend Architecture with ASP.NET Core & C# .NET** — 400 Hours

Clean Architecture, event-driven microservices, MassTransit/RabbitMQ distributed messaging & Transactional Outbox

**Relational Database Architecture & Administration with SQL Server** — 360 Hours

Advanced indexing strategies, execution plan tuning, ACID transactional integrity & concurrency management

**Computer Networking & Infrastructure Engineering — Network+** — 450 Hours

Enterprise network topologies, TCP/IP stack mechanics, low-level socket programming & distributed client/server security

**Comprehensive Professional English Language Programs (Childhood to Present)** — Multi-Term

Shokouh Language Institute — Consecutive honors transcripts (scores 91–100); fluent technical writing & international communication

## Technical Competency Matrix

Python (FastAPI, AsyncIO, Celery) | C# (.NET 10 Clean Architecture) | TypeScript / Next.js 15 | Multi-Agent Swarms | Semantic Kernel | AutoGen | Model Context Protocol (MCP) | Qdrant Vector DB | RAG Architecture | faster-whisper (CUDA) | Gemini Multimodal Live API | WASAPI Audio Loopback | OpenCV Vision Diffing | Electron ASAR Patching | Docker Compose | RabbitMQ / MassTransit | Redis AOF | SQL Server / PostgreSQL | Prometheus / Grafana / Jaeger | Unity 6.3 (URP, Zero-GC) | Box2D Ragdoll Physics | Git Plumbing

## Languages

**Persian:** Native — professional technical writing, architecture documentation, and system specifications

**English:** Professional working proficiency — deep architectural whitepapers, codebases, and global communication

**German:** Intermediate (Active B1 learner) — solid grasp of Menschen CEFR grammar structures and multimodal audio synthesis

**Albert (Iman Mansour) — AI Systems Engineer & Autonomous Agent Architect**

Open for high-impact AI systems engineering, distributed enterprise architectures, and cutting-edge software roles
